(a)
stratifications: originally (open) and by layers
z against random samples
B10
C100
D100
1 − W₁₀₀ (share of the variance of χ_D(p), p ≤ 100, removed)
(b)
line through two points with precise values
B10 ratio 0.89
C100 ratio 0.56
D100 ratio 0.39
reduction of layer 0 exactly from the zeros
reduction of layer 0 by the line through two points
(c)
explicit formula: diagonal and with dual term
slope of the weights of χ_D(p): fit / formula
B10
C100
D100
cosine mode k
(d)
first zero: even (solid) and odd (dashed)
mean x₁ − USp(2N_eff(a))
B10
C100
D100
end of the calibration interval a (N_eff from the density on [0, a])
